**DEVELOPMENT AND APPLICATION OF HIGH
STRENGTH CONCRETE WITH
MULTI-FUNCTIONAL PROPERTIES**

By

YANG WEN

Thesis Submitted in Fulfillment as the Requirement for the
Doctor of Philosophy in Civil Engineering by Research
Degree in the Faculty of Engineering and Technology
Infrastructure

IUKL

2015

Declaration

I hereby declare that the dissertation submitted does not contain the other research results has been published or written, except the references in the thesis. Comrades working together with me to our institute to do any contribution has been made clear in the paper indicate and expressed gratitude.

Acknowledgement

I would like to express my gratitude to all those who helped me to complete this thesis.

It is difficult to overstate my gratitude to my Ph.D. supervisor, Prof. Feng Naiqian, Prof. Ideris and Dr. Ch'ng Guan Bee. With their enthusiasm, inspiration, and great efforts to explain things clearly and simply help a lot. Throughout my research and thesis-writing period, Prof. Feng provided encouragement, sound advice, good teaching, and lots of good ideas. I also wish to extend my appreciation to Mr. Ooi In Ou, Mr. Lee Geok Chai, Dr. Khor Mi Nee and Mr. Vong Kee Sin for their kind help, support and comment in preparing this thesis.

I would like to express my sincere gratitude to Mr. Wu Wengui and Mr. Wang Jun in China Construction Ready Mixed Concrete CO. LTD, for supporting me to Malaysia for PhD. I am very grateful to Gao Yuxing, Cheng Baojun, Liu Li, Deng Xiao, Liu Xiaoqin, Liu Tong, Song Zhenglin, Jia Lili, and all the help over my friends. It was with their support and help that I could complete the research work.

I would like to dedicate this thesis with grateful thanks to my wife, Wu Jing, and my daughter, Yang Ziqi, for their love, encouragement, patience and support, also to my parents for their support and encouragement to my job.

Lastly, Many thanks to all the friends I met during my stay in IUKL for making this place a second home away from home.

Abstract

As a major load-bearing engineering material, high-strength concrete is the inevitable trend of development. However, it has higher viscosity, hydration heat, and self shrinkage, which makes it difficult to pump and cast concrete and makes concrete prone to cracks in the process of curing. Therefore, how to overcome these drawbacks in high-strength concrete is the key in the technical development and application of high-strength concrete. This paper studies systematically the powder effect of cement-based binding materials, key technology of reducing self-shrinkage, self-curing technology and the preparation of powder-effect-based low-heat high-strength concrete. These technologies are used to prepare one or several kinds of self-curing, low-shrinkage, low hydration heat, and self-compacting high performance high-strength concrete to be applied in practical engineering. The following main conclusions are drawn from the research and application: 1. When the content of ultrafine powder ranges from 0 to 40%, the mixing of ultrafine powder can help improve the powder compaction of compound cementitious materials; 2. In the ternary system of fly ash ($D_{50}=3\mu\text{m}$), silicon ash, and cement, silicon ash can help further reduce the porosity of the compacted bulk; 3. Reducing the initial packing porosity of the powder system can enhance the fluidity of the newly mixed cement paste and the packing density of the hardened cement paste; 4. Reducing cement can reduce the temperature rise caused by hydration in the concrete, and reducing the fineness of fly ash can significantly improve every performance of the concrete; 5. Preparing high-strength concrete with low heat Portland cement can reduce the adiabatic temperature rise of the concrete by $6-10^{\circ}\text{C}$; 6. Using broken ice as a phase change material in high-strength large volume concrete can effectively reduce the concreting temperature of the concrete; 7. Using the imported water in the self-curing materials is an effective way to reduce self-desiccation in the hydration of cement and avoid great shrinkage and cracking of high-strength concrete in the early age; 8. In application, concrete can be “customized” in accordance with the requirements of the designer and the constructor and the features of various important or difficult projects.

Chapter 1: Introduction

This chapter serves as an introduction to the study of high strength concrete which possesses special characteristics such as self-curing, self-compacting, low-hydration heat and so on. The definition and nature of HPC are initially given in brief. This is followed by a section explaining some of the practical engineering problems posed by HPC as encountered by engineers in the field. Although considerable efforts have been made over several decades to investigate and develop HPC, there seemed to be little work on the use of composite binder in HPC for high rise buildings. A section dealing specifically with this type of concrete is given in brief. Finally a section on the aims of the project is given at the end of the chapter, explaining briefly the aspects of HPC that are investigated in this thesis.

A more detailed review of previous work on the performance of HPC is given in Chapter 2 and the objectives and project methodology described in this thesis are fully explained in Chapter 3.

The concrete was developing to have low shrinkage ability, low hydration heat and high cracks resistance. The design and development of this type of concrete requires special consideration in many aspects from selection of raw materials, design criteria, material characterization, engineering properties of fresh and hardened concrete and finally the application in high rise building.
